

## **Army Risk Management Information System**

### **What is it?**

The Army Risk Management Information System is the central repository for all data related to reportable Army accidents (Class A-D, ground on and off duty; Class A-E, aviation). The tool is designed to give leaders, safety officers and other personnel access to both current and archived accident reports so they can work to prevent similar incidents within their formations. Among other functionalities, users may search RMIS for a specific accident by case number; conduct searches for a given timeframe or accident class; and obtain risk and hazard reports broken down by age, grade, equipment and additional variables. All data retrieved from RMIS is classified For Official Use Only and is limited in use to accident prevention.

### **What has Army Safety done?**

In early 2011, RMIS underwent a major upgrade that provides users more functionality, better navigation and easy-to-use features that enhance accident research. The tool is now a one-stop shop for all Army accident data and is an essential part of every unit's safety program.

### **What does Army Safety have planned for the future?**

Based on user needs and feedback, RMIS will continue to evolve into the best possible tool for leaders, safety professionals and Soldiers in the field. In accordance with Department of Defense policy, RMIS will migrate to Common Access Card-only authentication beginning Dec. 1, 2011. Soldiers, Department of the Army Civilians, contractors and other DoD personnel interested in obtaining access to RMIS should contact the U.S. Army Combat Readiness/Safety Center Help Desk at [safe.helpdesk@conus.army.mil](mailto:safe.helpdesk@conus.army.mil) to obtain necessary permissions and password/username (non-Army Knowledge Online users only).

### **Why is this important to the Army?**

There are rarely any "new" Army accidents — rather, the same accidents occur again and again, only with different people, times and places. By providing leaders and safety officers the most comprehensive accident information available, RMIS is an invaluable tool in building and maintaining effective risk management programs.
